- Extension lines: Extend from the object to dimension lines.

Projection Methods and Views

Q4: Explain the different types of projection methods used in engineering drawings.

A: The primary projection methods are:

- First Angle Projection: Used mainly in Europe and Asia. The object is positioned between the observer and the plane of projection.

- Third Angle Projection: Commonly used in the USA. The object is projected onto the plane from the observer?s viewpoint, with views arranged accordingly.

Q5: How are the principal views arranged in a drawing?

A: The principal views include:

- Front View: Shows the most characteristic features.
- Top View (Plan): Placed above the front view.
- Side View: Usually placed on the right side of the front view.

The arrangement depends on the projection method used.

Q6: What is an isometric view? How does it differ from orthographic views?

A: An isometric view is a pictorial representation where the object is rotated to show three dimensions simultaneously, with axes inclined at 120°. Orthographic views are 2D projections (front, top, side) that represent the object from specific directions, providing precise measurements.

Drawing Standards and Conventions

Q7: What are the standard dimensions and tolerances in engineering drawings?

A: Dimensions are specified according to standards like ISO, ASME, or BIS, depending on the region. Tolerances specify permissible variations in dimensions to ensure proper fit and function, often indicated using general or specific tolerance blocks.

Q8: Why are sectional views used?

A: Sectional views reveal internal features that are not visible externally, making complex internal details clearer and easier to understand.

Detailed Review of Key Viva Questions with Answers

1. What is engineering drawing? Why is it important?

Answer:

Engineering drawing is a graphical language used by engineers to represent objects, components, and assemblies with precise details. It incorporates standard conventions, symbols, and projections to communicate complex information succinctly. Its importance lies in:

- Providing an unambiguous visual representation of parts
- Facilitating manufacturing and assembly processes
- Ensuring clear communication among engineers, manufacturers, and clients
- Serving as a legal document for design specifications

2. What are the different types of projections used in engineering drawing?

Answer:

The primary types of projections include:

- Orthographic Projection: Projects views of an object onto perpendicular planes, typically front, top, and side views, to represent the object in 2D.
- Isometric Projection: A 3D representation where the object is inclined to show three dimensions, with axes equally inclined at 120°.
- Oblique Projection: Shows the object with one face directly facing the viewer, with the third dimension projected at an angle.
- Perspective Projection: Mimics human eye perception, showing depth and foreshortening, often used in renderings.

Expert Tip: Orthographic projection is most commonly used for detailed drawings, while isometric and perspective views are used for presentation purposes.

3. Describe the different types of lines used in engineering drawings and their significance.

Answer:

Lines are fundamental in conveying information. The main types include:

- Visible or Object Lines (Thick solid lines): Show the edges and contours of the object.
- Hidden Lines (Dashed lines): Represent edges not visible in the current view.
- Center Lines (Long-short dashed lines): Indicate axes of symmetry or centers of holes.
- Section Lines (Hatched lines): Show cut surfaces in sectional views.
- Dimension Lines: Indicate measurements, with arrowheads pointing to the extent of the dimension.
- Extension Lines: Extend from the object to dimension lines.
- Break Lines: Show that a part has been shortened or broken for clarity.

Expert Tip: Consistency in line types enhances clarity and adherence to standards like ISO or ASME.

4. How do you differentiate between a full section and a half section? When is each used?

Answer:

- Full Section: The object is cut entirely along a plane, revealing internal features in a sectional view. It is used when the internal features are complex or symmetrical.
- Half Section: The object is cut only in half, showing both the internal and external features

simultaneously. It is suitable for symmetrical objects like shafts or gears.

Usage tips:

- Use a full section to reveal internal details that are not apparent externally.
- Use a half section to illustrate both internal and external features without cluttering the drawing.

5. Explain the principle of dimensioning and the rules to be followed.

Answer:

Dimensioning is the process of adding measurements to a drawing to define size, location, and geometry. Proper dimensioning ensures clarity and manufacturability. The key rules include:

- Clarity: Dimensions should be unambiguous and easily readable.
- Completeness: All necessary dimensions for manufacturing should be provided.
- Avoid Redundancy: Do not duplicate dimensions; each should serve a clear purpose.
- Placement: Dimensions should be placed outside the object outline whenever possible, avoiding crossing lines.
- Chain Dimensioning: Dimensions should be linked logically without over-reliance on cumulative measurements.
- Dimensioning of Features: Critical features should be dimensioned precisely, with tolerances indicated.

Expert Tip: Use consistent units and avoid clutter by grouping related dimensions.

6. What are the different types of sectional views? Explain each with examples.

Answer:

Sectional views are used to reveal internal features of an object by cutting through it:

- Full Section: Entire object is cut along a plane, showing internal details.
- Half Section: Half of the object is cut, showing interior and exterior simultaneously.
- Offset Section: Cutting plane is bent to include multiple features in a single sectional view.
- Broken-Out Section: A small portion of the object is cut away to reveal specific internal features without a full sectional view.
- Revolved Section: A section about a axis is rotated into the plane to show the internal shape.

Example: A gear might be shown with a full section to illustrate the bore and keyway, while a shaft might be shown with a half section.

7. What are the standard conventions for dimensioning holes and diameters?

Answer:

- Holes are dimensioned by their diameter, usually marked with the symbol "Ø."
- For threaded holes, both diameter and thread size are specified.
- The location of holes is given using dimensions from reference features or edges.
- Depth of holes is indicated if relevant.
- For multiple holes, distances between centers are dimensioned.
- Tolerances are added as per the required fit and function.

Expert Tip: Use uniform units and avoid cluttering the drawing with excessive dimensions.

8. How do you interpret different types of engineering materials based on drawing symbols and notes?

Answer:

Materials are indicated through standard symbols, abbreviations, and notes:

- Material specifications are usually written in notes or within a Bill of Materials (BOM).
- Symbols can denote:
- Steel (S), Cast Iron (CI), Aluminum (Al), etc.
- Surface finish symbols specify roughness.
- Coating or plating instructions are indicated by specific symbols.
- Tolerance notes specify permissible variations affecting material properties.

Expert Tip: Always cross-reference symbols with relevant standards (ISO, ASME) for accurate interpretation.

9. What is the significance of tolerances in engineering drawing?

Answer:

Tolerances define the permissible variation in dimensions, ensuring parts fit and function correctly. They are crucial because:

- They accommodate manufacturing inaccuracies.
- They control the quality of the final product.
- They influence cost?tighter tolerances are more expensive.
- They determine the interchangeability of parts.

Common tolerance types include:

- Limit Tolerance: Specifies maximum and minimum dimensions.
- Deviation Tolerance: Indicates the allowed variation from the specified dimension.
- Geometric Tolerances: Control shape, orientation, and position.

Expert Tip: Use the least tolerances necessary to balance quality and cost.

10. How do you prepare for a viva on engineering drawing? What tips would you give?

Answer:

Preparation involves:

- Thoroughly understanding drawing standards and conventions.
- Practicing the explanation of different views, projections, and symbols.
- Reviewing common questions and practicing concise, clear answers.
- Familiarizing oneself with the drawing tools and their proper use.
- Studying sample drawings and practicing interpretation.
